

# About EMR Quick Picks

Last Modified on 08/30/2024 9:26 am EDT

Quick Picks are a function within the EMR portal that allows a user to create stored text or expressions that can be applied to any free text box or text area within the EMR portal. Generally this text is used for documentation purposes within a template. An example would be to have a common treatment plan phrase stored, that would then be copied and pasted to a free text area within the Treatment Plan template.

The Quick Pick builder allows a single user to create common phrases that can only be accessed by that user. Quick Picks can not be shared amongst multiple users.
