

User Favorites for Problem List

Last Modified on 08/03/2026 7:51 pm EDT

Favorites let you keep the codes you use most at your fingertips. When you search to add a problem, your favorites are listed first, so common problems are one click away.

The screenshot shows the 'Problems' search interface. At the top, there's a search bar with a dropdown menu set to 'ICD Code'. To the right of the search bar are buttons for 'Import Queue', a refresh icon, and a menu icon. Below the search bar, there's a 'Quick Add' toggle switch. The search results are displayed in a list. The first three results are 'Chronic kidney disease, stage 3 unspecified' (N1830), 'Chronic kidney disease, stage 3a' (N1831), and 'Chronic kidney disease, stage 3b' (N1832). Each result has a star icon next to it, indicating it's a favorite. The fourth result is 'Elevated prostate specific antigen [PSA]' (R972), which also has a star icon. To the right of the search results, there's a 'Notes' toggle switch and a 'Copy Note' button. Below the search results, there's a section for 'AC-B verification: thyroid follow-up, levothyroxine increased to 100 mcg daily pending repeat TSH.' and a 'Drug Interactions' dropdown menu.

How favorites appear

When you open the problem search, your favorite codes are shown before any other results and are marked with a **star**. As you type, favorites that match stay sorted to the top of the results. See [Add a Problem](#) for the full search steps.

Add a favorite

1. Start a problem search and find the code you want.
2. Click the **star** icon next to that result.
3. The star fills in to show the code is now a favorite.

Remove a favorite

1. Find the code in the search results (favorites appear at the top).
2. Click the filled **star** icon to remove it from your favorites.

Favorites are tied to **your** account, so each staff member keeps their own list. Adding or removing a favorite does not change any problem already on a patient's chart.
